## Vibration/Shock Terminology

**Amplitude**—The magnitude of a force, displacement or acceleration from some reference point.

**Damping**—The dissipation of energy. Two types of damping are: Coulomb or friction damping, and Hysteretic or inherent damping.

**Frequency**—The number of oscillations that occur in a given time period. It is measured in cycles per second (CPS) or Hertz (Hz), cycles per minute (CPM) or strokes per minute (SPM).

**Natural Frequency**—The frequency of vibration that occurs if a system is moved from its normal position and allowed to vibrate freely.

**Resonance**—A condition that occurs when the forcing frequency coincides with the natural frequency of a suspension system. Avoid this at all costs.

**Shock**—A transient event defined by a sudden change of motion, force or velocity.

**Spring Rate**—A measurement of stiffness. It is a constant defined by the ratio of force to the corresponding deflection and is expressed in pounds/inch.

**Structural Damping**—Damping which reduces the vibration of resonating surfaces that radiate noise. Damping is accomplished by affixing a material directly to the vibrating surface. This material converts the mechanical vibration to a minimal amount of heat energy.

**Transmissibility**—A dimensionless ratio of the dynamic output to the dynamic input.

**Vibration**—An oscillation in a mechanical system about some reference point. Frequency and amplitude are used to define that oscillation.

# Technical Section

## Vibration

This outline of basic vibration theory is intended to present a simplified approach to application and sizing of isolators. It will enable the design engineer to select the proper isolator to reduce the harmful effects of vibration. Obviously, real life situations are more complex than this simplified approach indicates.

Vibration is defined as a magnitude (force, displacement, or acceleration) which oscillates about a reference point. Vibration is commonly expressed in terms of frequency, cycles per second or Hertz (Hz).

Vibration problems generally fall into two classes.

**1. Force excitation:** The isolator is used to protect the supporting structure from forces generated by the supported mass (see Figure 1). An example is the use of motor mounts in an automobile.

**2. Motion excitation:** The isolator is used to protect the supported mass from disturbances of the supporting structure (see Figure 2). An example is the use of mounts under a coordinate measuring machine.

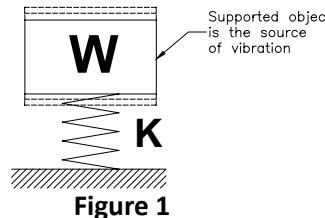

Figure 1

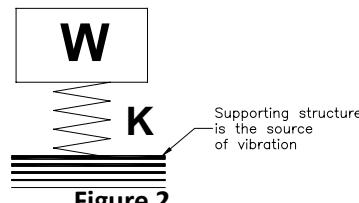

Figure 2

Natural Frequency is the frequency of vibration that will occur if a system is disturbed from its normal position and allowed to vibrate freely. For our purposes the natural frequency can be defined as a function of mass and stiffness or spring rate. If the spring rate is linear, the load vs. deflection curve is a straight line (Figure 3). For instance, a load of 100 pounds will cause a deflection of .20 inches. This spring will have a stiffness of:

$$K = \frac{W}{D} = \frac{100}{.20} = 500 \frac{\text{lbs}}{\text{inch}}$$

Where: K = Stiffness (pounds per inch)  
W = Weight of load (pounds)  
D = Deflection (inches)

If we assume the supported item is a rigid body, the system will have a well-defined Natural Frequency ( $f_n$ ).

$$f_n = \frac{1}{2\pi} \sqrt{\frac{Kg}{W}}$$

or removing the constants:

$$f_n = 3.13 \sqrt{\frac{K}{W}}$$

Where: W = Weight of load (pounds)  
g = Acceleration due to gravity  
(386 in./sec.<sup>2</sup>)  
 $\pi = 3.1416$

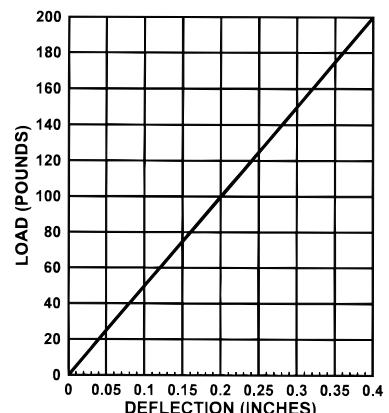

Figure 3

# Technical Section

If the frequency of the input that we are isolating from (the forcing frequency) is defined as  $f_f$ , it can be shown that if the spring has been selected so that:

$$\frac{f_f}{f_n} > \sqrt{2}$$

the displacement of the isolated item will be less than that of the input. This is the basis for vibration isolation (Figure 4).

However, if:

$$\frac{f_f}{f_n} < \sqrt{2}$$

the displacement of the isolated item will be greater than that of the input. This is the region of amplification (Figure 4).

Since Transmissibility ( $T$ ) is defined as the ratio of the output to the input:

$$T = \frac{\text{output}}{\text{input}}$$

maximum transmissibility always occurs when the forcing frequency ( $f_f$ ) and the natural frequency ( $f_n$ ) coincide. This is commonly called the resonant point.

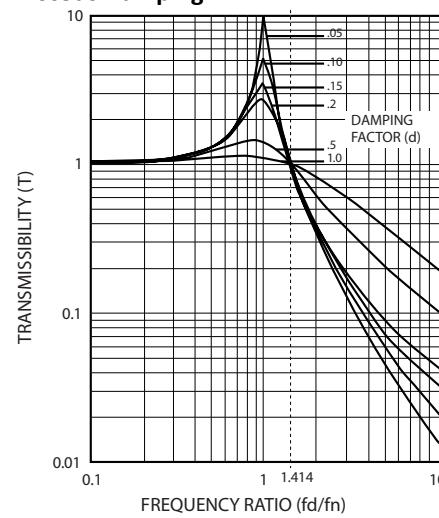

If  $T$  is greater than one, amplification is occurring. If  $T$  is less than one, isolation is occurring.

Figure 4 depicts typical transmissibility curves for various damping conditions. Damping ( $d$ ) is defined as the dissipation of energy by conversion to heat. Note that damping affects the magnitude of the response; it has little affect on the frequency of the response. Figure 5 gives damping factors for some typical materials.

Figure 4 indicates that while the maximum transmissibility varies with damping, for lower damping values the crossover point is always:

$$f_n\sqrt{2}$$

**Typical Transmissibility For Viscous Damping**

**Figure 4**

**Typical Damping Factors**

Material	d
Natural Rubber	.05
Neoprene	.05
Felt and Cork	.06
Butyl	.10
High Damped Silicone	.15+
Friction Damped Spring	.30+

**Figure 5**

The three types of damping usually encountered are friction (Coulomb), hysteretic and viscous.

Friction damping is characterized by sliding surfaces. Hysteretic damping is the damping that is inherent in a material. Viscous (or fluid) damping is characterized by proportional relationships between forces and velocities, e.g. an object moving through a liquid.

# Technical Section

Transmissibility ( $T$ ) is the ratio of the output to the input. If the input amplitude is .10 inches, and the output is .025 inches, the transmissibility will be:

$$T = \frac{\text{output}}{\text{input}} = \frac{.025}{.100} = .25$$

The percent of isoaltion can be expressed as:

$$\% \text{ Isolation} = (1 - T) \times 100$$

or in this case:

$$\% \text{ Isolation} = (1 - .25) \times 100 = 75\%$$

Quite often the magnitude of amplification at resonance is important. This point of maximum transmissibility is solely determined by the amount of damping ( $d$ ) in the isolator. For isolators,  $d$  is typically .06 to .20. A simplified expression for maximum amplification ( $Q$ ) for lower damping values is given by:

$$Q = \frac{1}{2d}$$

If  $d = .15$  (typical of a high damped silicone)

$$Q = \frac{1}{2(.15)} = 3.33$$

The amplification factor at resonance for most isolators varies between 2.5 and 8.0.

While damping is desirable to control the response at resonance, it actually decreases the isolation at higher frequencies. As Figure 4 indicates, the more damping in a system, the less isolation at frequencies above  $f_n\sqrt{2}$ .

If the forcing frequency ( $f_f$ ) and the desired transmissibility are known, the required system natural frequency is calculated by:

$$f_n = \frac{f_f}{\sqrt{\frac{1}{T} + 1}}$$

For instance, if  $f_f$  is 20 Hz and  $T$  is .25, then the maximum acceptable  $f_n$  is 8.9 Hz.

This equation is presented in nomograph form as Figure 8 on page 7.

## EXAMPLE

A unit with a weight of 800 pounds is to be mounted on four isolators. The center of gravity is located at the center of the unit. The forcing frequency is 30 Hz and 80% isolation, or a transmissibility of .20 is desired.

With four isolators, the load supported by each will be 200 pounds. If the unit's center of gravity is eccentric, a load distribution analysis must be made to determine the load at each mounting point.

Loads versus natural frequency curves are available for most Tech Products isolators. Often several isolators can be selected using these curves. The load versus frequency curves for the 515 Series may result in a proper isolator selection; however, there are always other conditions to consider. These may be: shock requirements, available space, mounting orientation or environmental conditions.

First the required system natural frequency is determined:

$$f_n = \frac{f_f}{\sqrt{\frac{1}{T} + 1}} = \frac{30}{\sqrt{\frac{1}{.20} + 1}} = 12.2 \text{ Hz}$$

Next, choose a load versus natural frequency curve where the supported weight is about in the middle of the load range. If, after the calculations are made, desirable results are not obtained, go to the curves of the next larger or smaller mount and repeat the calculations.

Figures 6 and 7 show the curves for a typical mount that has been selected for this application. Draw a horizontal line across Figure 7 at 200 pounds on the load axis. Then draw a vertical line across Figure 7 from 12.2 Hz on the natural frequency axis. The intersection of the two lines is slightly to the left of curve -4 on Figure 7.

# Technical Section

If a vertical line is drawn to the frequency axis from the point where the 200 pound line intersects curve -4, the natural frequency value is 12.5 Hz. This is slightly higher than the 12.2 Hz calculated. However, it is close enough so that the -4 could be selected.

If  $f_n = 12.5$  Hz is put into the transmissibility equation

$$T = \frac{1}{(\frac{f_f}{f_n})^2 - 1}$$

$T = .21$  or approximately 79% isolation. One should note that the magnitude of the input would affect the system's natural frequency. The modulus of elastomeric materials is strain sensitive, so at very small inputs the natural frequency will be slightly more than calculated and slightly less at very high inputs.

## "Shortcuts"

The preceding transmissibility equation is graphically produced in Figure 8.

Using the previous example, where the forcing frequency is 30 Hz and 80% isolation is desired: Draw a horizontal line across Figure 8 located at 30 Hz on the forcing frequency axis to the intersection of the 80% isolation line. Draw a vertical line down to the natural frequency axis. This point defines the required system's natural frequency to be approximately 12 Hz.

From the natural frequency equation given on page 6, it can be shown that the natural frequency is a function of the isolator static deflection ( $\Delta S$ ). That is:

$$\text{if } f_n = 3.13 \sqrt{\frac{K}{W}}$$

$$\text{and } K = \frac{W}{\Delta S} \text{ then } f_n = 3.13 \sqrt{\frac{1}{\Delta S}}$$

If load vs. frequency curves are not available, then Figure 9 can be used to help select an isolator. The desired natural frequency is determined as in the example previously discussed (12.2 Hz). Draw a horizontal line from 12.2 Hz on the natural frequency axis to the intersection of the dark diagonal line. Draw a vertical line down to the intersection of the static deflection axis. This point, approximately .065 inches, is the static deflection required of the isolator to produce a natural frequency of 12.2 Hz. Load deflection curves can now be used to determine what isolator will produce .065 inches deflection at the given load.

# Technical Section

## Shock

Shock is normally classified as a transient phenomenon in contrast to vibration that is normally a steady-state phenomenon.

Shock isolation is considerably different from vibration isolation. A shock isolator is an energy storage device that stores the input energy by deflecting and then releasing that energy over a longer period of time. The energy is released at the natural frequency of the shock isolation system.

Shock is normally defined by a pulse or a free-fall impact. Some typical pulse shapes are half-sine, triangular, rectangular and versed-sine.

A convenient way to analyze shock problems is to use the velocity change method. Figure 10 gives equations to calculate the velocity change ( $V$ ) for various shock excitations.

The transmitted shock ( $G_t$ ) is given by:

$$G_t = \frac{V(2\pi f_n)}{g} = \frac{V(f_n)}{61.4}$$

The associated dynamic deflection ( $\Delta d$ ) can be determined by:

$$\Delta d = \frac{V}{2\pi f_n}$$

## EXAMPLE

A piece of equipment is subjected to a 24-inch ( $h$ ) free-fall drop. It is known that the equipment cannot withstand more than 25 g's, i.e. the fragility level is 25 g's. The equipment weighs 400 pounds.

Using the transmitted shock ( $G_t$ ) equation and setting  $G_t$  to 25 and solving for  $f_n$ :

$$G_t = \frac{V(f_n)}{61.4}$$

$$\text{or } f_n = \frac{G_t(61.4)}{V} = \frac{25(61.4)}{V}$$

From Figure 10,  $V = \sqrt{2gh}$

where:  
 $h$  = drop height in inches  
 $g$  = acceleration due to gravity (386 in/sec<sup>2</sup>)

$$\text{or } V = \sqrt{2(386)(24)} = 136 \text{ in/sec}$$

The required natural frequency is:

$$f_n = \frac{25(61.4)}{136} = 11.3 \text{ Hz}$$

The required dynamic deflection ( $\Delta d$ ) is:

$$\Delta d = \frac{V}{2\pi f_n} = \frac{136}{2\pi(11.3)} = 1.92 \text{ inches}$$

Now calculate the required dynamic stiffness ( $K$ ) for the system.

$$\text{Since } f_n = 3.13 \sqrt{\frac{K}{W}}$$

$$K = \frac{(f_n)^2 W}{(3.13)^2} = \frac{(11.3)^2 W}{(3.13)^2}$$

$$\text{or } K = 5213 \text{ lbs/inch}$$

We have now found that to protect the equipment from the 24-inch drop we need"

1. A system natural frequency of 11.3 Hz
2. A dynamic deflection of 1.92 inches
3. A dynamic system stiffness of 5213 lbs/inch.

All three of these conditions must be met to assure that no more than 25 g's is transmitted to the equipment.

# Elastomer Properties

Tech Products offers a variety of standard elastomers for all types of isolators. Proper selection of elastomer based on mechanical properties, temperature range, and chemical resistance is crucial to optimizing the life of the isolators. Following is basic information for Tech Products standard elastomer options. Other elastomers and custom compounds are also available.

<b>Neoprene:</b>	<b>Butyl:</b>
Adhesion to Metal:	Excellent
Tensile Strength:	Excellent
Compression Set:	Fair
Damping Factor (C/Cc):	0.05
Operating Temperature:	-20 to 180°F
Oil Resistance:	Good
Ozone Resistance:	Good
Weather / Sunlight Aging:	Good
Heat Aging:	Good
<b>Natural Rubber:</b>	<b>Silicone:</b>
Adhesion to Metal:	Excellent
Tensile Strength:	Excellent
Compression Set:	Good
Damping Factor (C/Cc):	0.05
Operating Temperature:	-20 to 180°F
Oil Resistance:	Poor
Ozone Resistance:	Poor
Weather / Sunlight Aging:	Poor
Heat Aging:	Fair
<b>Nitrile:</b>	<b>High Damped Silicone:</b>
Adhesion to Metal:	Excellent
Tensile Strength:	Excellent
Compression Set:	Good
Damping Factor (C/Cc):	0.05
Operating Temperature:	-20 to 180°F
Oil Resistance:	Excellent
Ozone Resistance:	Fair
Weather / Sunlight Aging:	Fair
Heat Aging:	Good

# Engineering Analysis

Tech Products offers complete engineering analysis for all types of applications. The information below is required for a full six degree of freedom analysis of engine isolation applications. For other applications, please contact Tech Products at engr@novibes.com. Forms are also available at <http://www.novibes.com/Services>.

# Pivotal Levelers

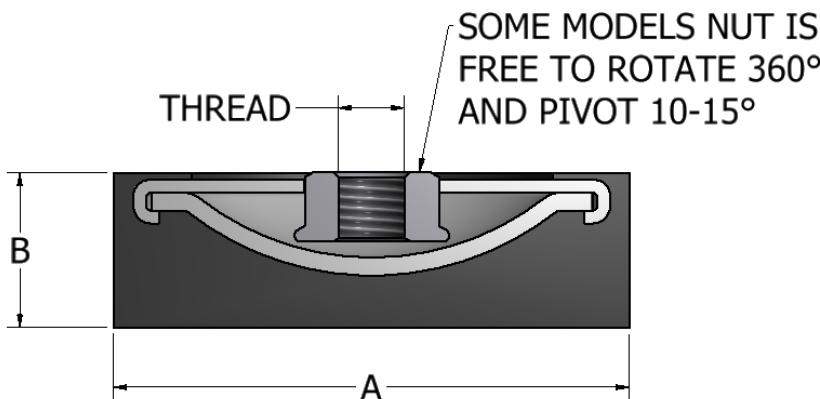

Patented Pivotal Levelers keep equipment level and isolate noise and vibration for about one-third to one-half the cost of ordinary machine mounts.

You can quickly and easily attach Pivotal Levelers to everything from computers and compressors to presses and pumps. These self-aligning, self-contained units handle

equipment up to 8,000 lbs., providing stability, isolation and shock protection while allowing complete portability. They permit 1/4" or more of leveling, depending on the attachment hardware used.

Pivotal Levelers are made of bonded neoprene/steel for long service life and resistance to ozone and oils.

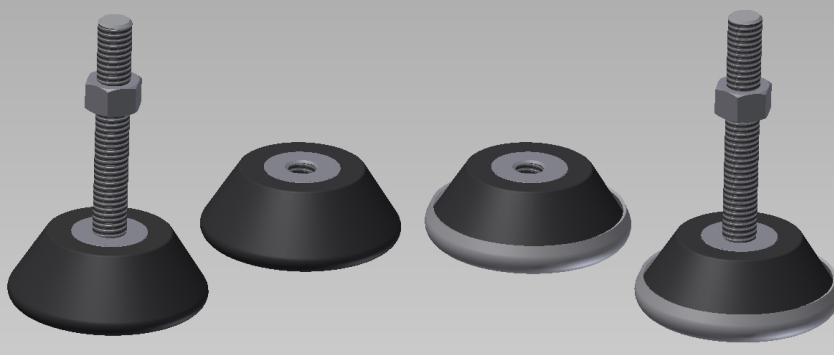

# Pivotal Levelers

Add -A to part number for 5" long epoxied stud and hex nut

# Mounting Feet

Tech Products Mounting Feet let you isolate all types of machinery and equipment from vibration and floor motion. They are made of neoprene bonded to a steel insert. All models are available with zinc-plated steel glides.

Multi-use Mounting Feet are used on business machines, light manufacturing machinery, precision equipment in fields such as optics, and almost anywhere else vibration presents a problem.

- Load capacity from 6 to 1000 lbs.
- Neoprene elastomer resistant to most oils, fuels, and solvents
- Steel Glide bottom available
- Available with attachment hardware
- **Add -A to Part Numbers for 2.5" epoxied stud and hex nut**

# Machine Leveling Mounts

Whenever you need to protect heavy production equipment from shock and vibration, this rugged series of Leveling Mounts will do the job to your full satisfaction.

Their no-walk, no-creep performance lets you place your equipment wherever you wish without bolting it to the floor and to move it easily without re-anchoring or re-shimming.

Even when immersed in oil, water or other hazards, the high strength steel housing and neoprene base resist failure for years of daily punishment.

We offer six standard load ranges to closely match your weight and dimensional requirements. Punch presses, milling machines, injection molding equipment, lathes, compressors, mixers...any equipment that generates motion internally or is affected by external vibration can be economically mounted for top performance plus complete portability.

Leveling is simple and quick with internal adjustment capability up to  $\frac{1}{2}$  inch above loaded height, just by a few turns of the leveling bolt. Then the locknut is tightened on the machine foot for a permanent, precise mount.

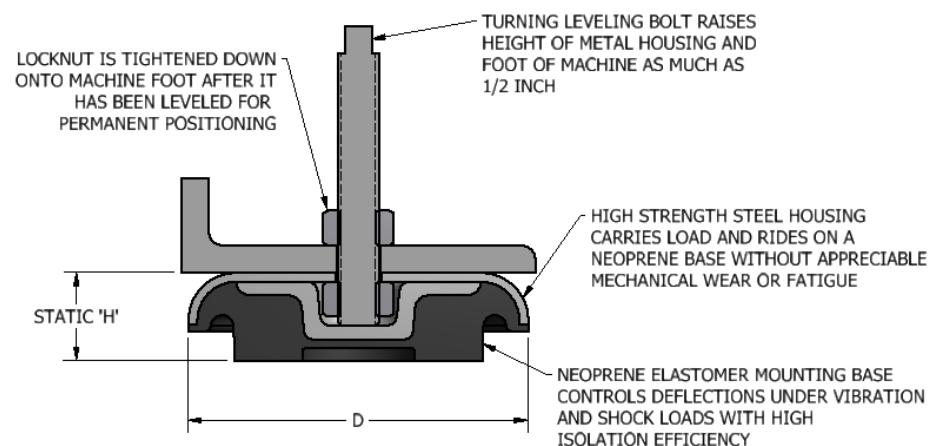

## Features and Benefits:

- Easy Leveling
- Reduce Installation and Relocation Costs
- No Special Foundations
- Isolate Shock and Vibration
- Reduce Noise Levels
- Meets OSHA anchoring Standards
- Reduce Maintenance Costs
- Improve Production Efficiency
- Approximately 8-12 Hz Natural Frequency at Max. Load
- Special Bolt Lengths, Diameters, and Reducer Bushings Available

## Applications:

- Injection Molding Machines
- Die Casting Machines
- Punch Presses
- Lathes
- Grinders
- Jig Borers
- Screw Machines
- Milling, Machines
- Brakes
- Four Slides
- And many others.

# Fail-Safe Compression Mounts

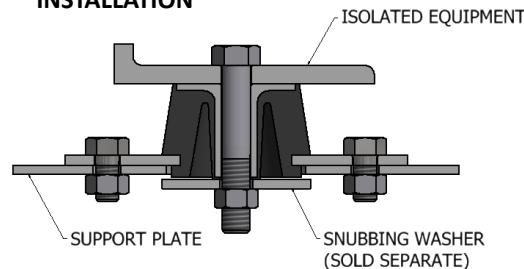

These fail-safe isolators are ideal for isolation of diesel engines and generators used in construction equipment, recreational vehicles and off-road equipment. The low natural frequency allows them to be used for computer and electronic equipment when there is a need for a "ruggedized" installation. They are also excellent isolators for compressors, motors, pumps and other machinery when skid mounted.

- Three sizes available for load ranges of 50 to 550 lbs.,
- High stiffness ratio of 6:1, axial-to-radial.
- Standard elastomer is neoprene,
- Resistant to ozone, fuel and oils.
- Temperature range of -20°F to +180°F.
- Optional materials such as nitrile, butyl, silicone and others are available to meet your environmental conditions or military specifications.
- These mounts are fail-safe when used with snubbing washers and installed as shown. See page 75 for snubbing washers.

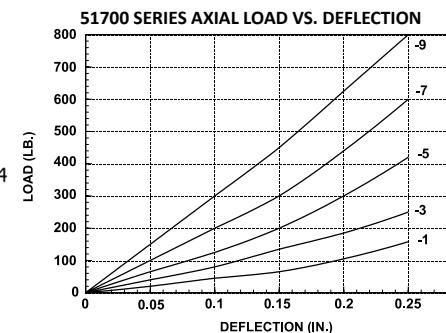

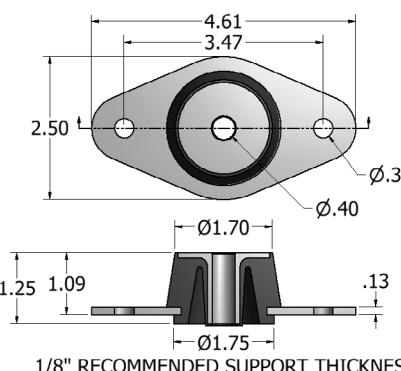

Part No.	Axial Static Load Rating: Nominal (lbs)	Color Code
51700-1	50	Yellow/Gold
51700-3	90	Red/Gold
51700-5	150	Green/Gold
51700-7	215	Blue/Gold
51700-9	300	White/Gold
51641-2	100	Yellow/Gold
51641-4	155	Red/Gold
51641-6	230	Green/Gold
51641-8	320	Blue/Gold
51641-10	420	White/Gold
51716-2	120	Yellow/Gold
51716-4	185	Red/Gold
51716-6	250	Green/Gold
51716-8	400	Blue/Gold
51716-10	550	White/Gold

## INSTALLATION

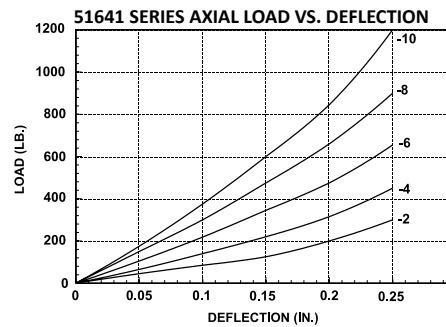

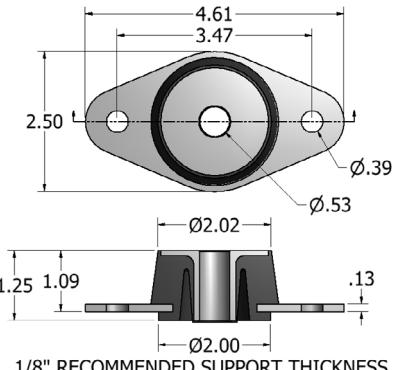

# Fail-Safe Compression Mounts

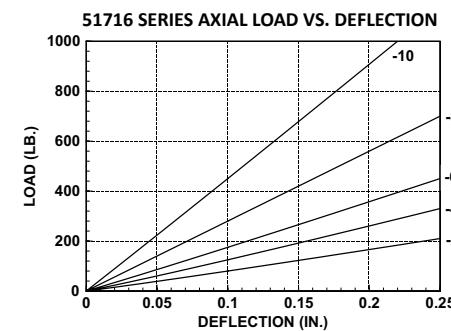

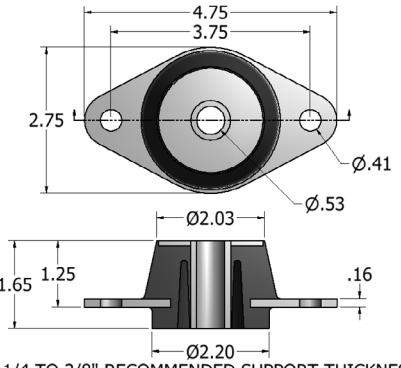

## 51700 Series

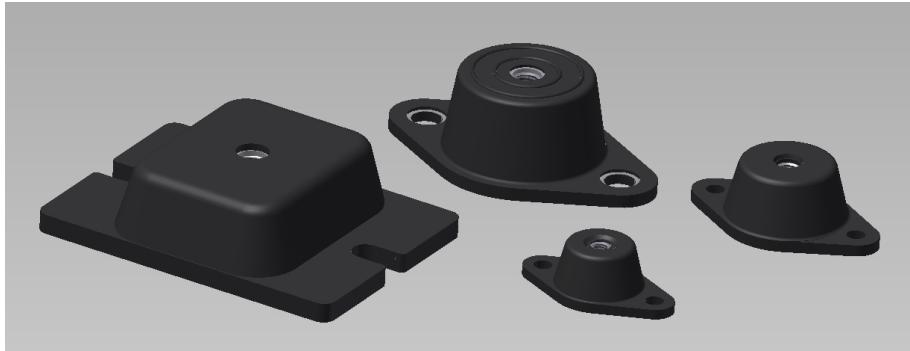

## 51641 Series

## 51716 Series

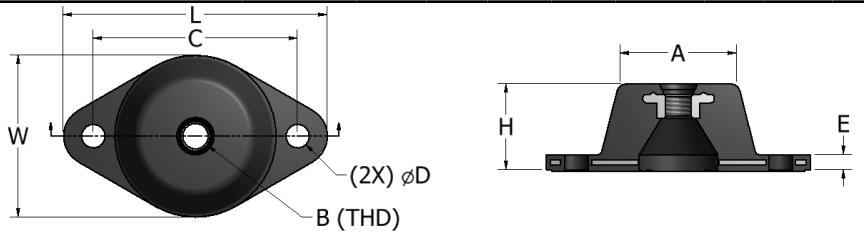

# Compression Mounts

## Standard Deflection

- Natural Frequencies as low as 6 Hz at maximum loads
- Constructed of Neoprene and steel
- Metric threads available

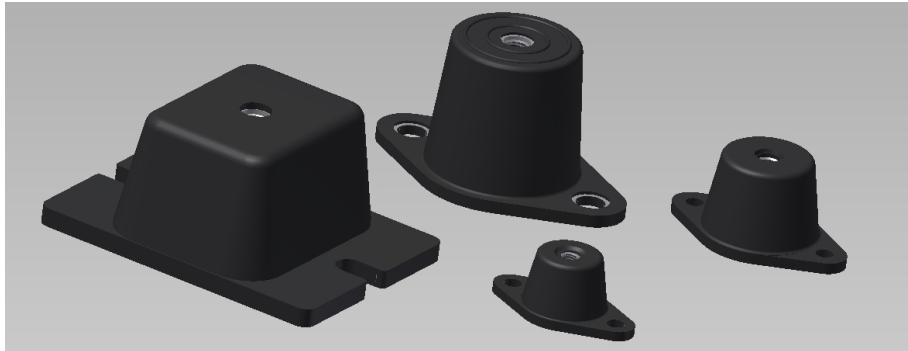

Part Numbers 52501 thru 52544 are also available in Silicone for an operating temperature range of -80° to 300°F. Add -S to part number for silicone.

# Compression Mounts

These rugged, high performance mounts are normally used for vertically applied loads to prevent the transmission of noise and vibration caused by the rotation of unbalanced equipment such as centrifuges, blowers, pumps, vibrators and air handling systems.

- Isolation of disturbing frequencies as low as 15 Hz
- Neoprene elastomer resistant to oil, fuel, and ozone
- -20° to +180°F operating temperature range

Part No.	Color Code	Load Range (lbs.)	W (in.)	Part No.	Color Code	Load Range (lbs.)	W (in.)

# Compression Mounts

## Heavy Duty

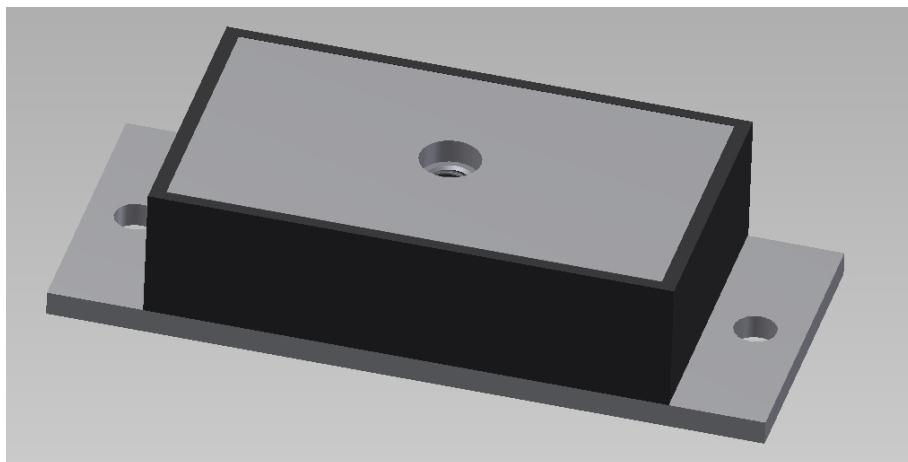

This compression mount design is for applications under heavy industrial machinery requiring efficient vibration, noise, and shock isolation. Typical applications include pumps, compressors, and generators.

- Low natural frequency of 8-15 Hz
- Can be mounted in pairs for lower natural frequencies (6-10 Hz)
- Constructed of cold-rolled steel and oil resistant neoprene

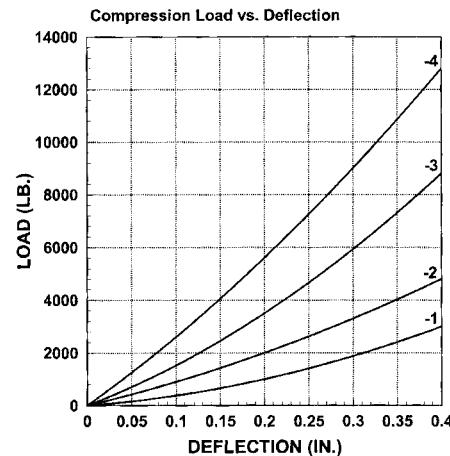

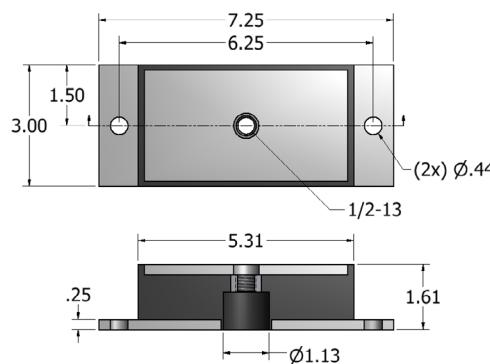

Part No.	Color Code	Max. Load (lbs.)	Part No.	Color Code	Max. Load (lbs.)
52171	Red	700	52135	White	1500

52173	Blue	1500	52137	Red	700
52174	White	2500			

## Heavy Duty Compression Mounts

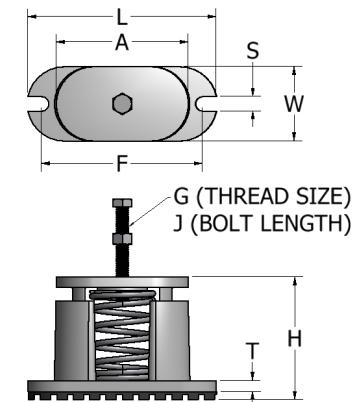

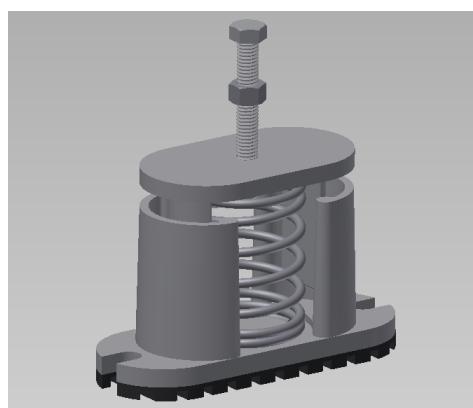

### Features:

- High Load Capacity
- Approx. 8 Hz Natural Frequency at rated load
- Low Maintenance
- Constructed of steel and neoprene
- Resistant to most oils, solvents, and ozone
- 5:1 vertical to horizontal stiffness ratio

Part No.	Color Code	Max. Load (lbs.)
52054-1	Green	1500
52054-2	Blue	2000
52054-3	White	3000
52054-4	Purple	4400

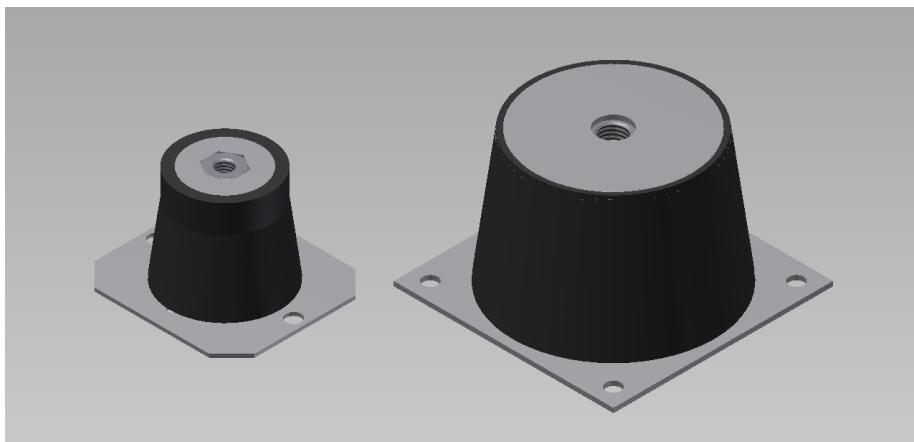

## Spring Mounts

Tech Products' spring mounts with aluminum housings are durable enough to handle most of the applications where steel housings are used. The aluminum housing is more weather resistant and lighter. The cast aluminum allows for higher quality thread integrity. The ribbed neoprene pad provides a non-skid base, and neoprene stabilizer pads are included in the housing to control lateral motion. All aluminum housed mounts include one spring with load ratings as high as 1300 lbs.

Part No.	Spring Color	Max. Load (lbs)	Static Defl.	L	W	H	A	F	G	J	S	T

# Low Frequency Mounts

Low Frequency Mounts' unique design bonds a steel spring inside a matrix of oil/ozone-resistant neoprene. The springs absorb low frequency vibrations, slowing and passing them on to the resilient neoprene. This material—made even more stable by the springs—interrupts the sound path, prevents noise amplification caused by sounding board effects, and stops vibrations from being transmitted to the floor or work surface.

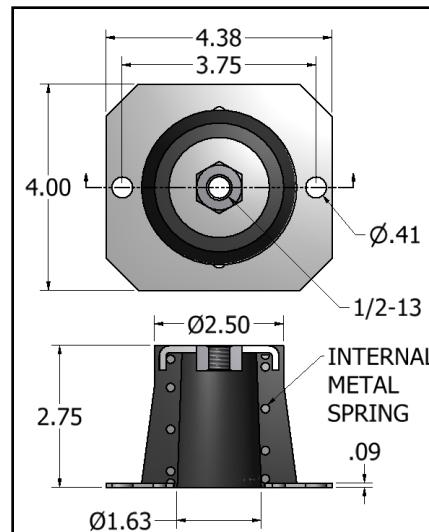

Low Frequency Mounts are made for your toughest vibration applications. They tame the effects of paint mixers, air conditioning units, air compressors and more, indoors and out. There are models for loads from 50 to 4,700 lbs. which exhibit 3.5 Hz natural frequency at maximum load.

## Typical Mounting Application

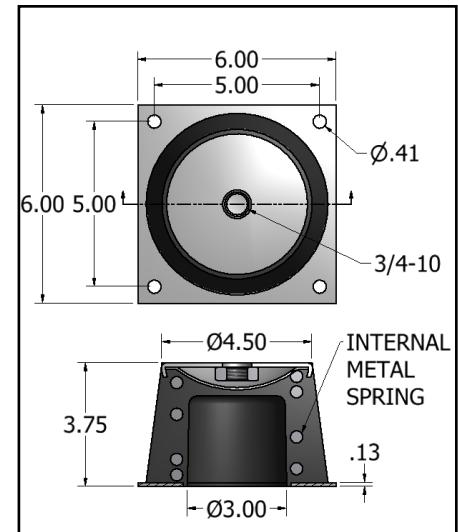

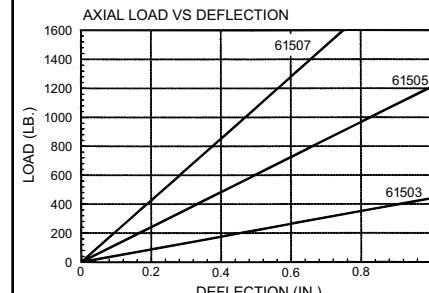

# Low Frequency Mounts

61064	White	1200	0.2	4700	0.8

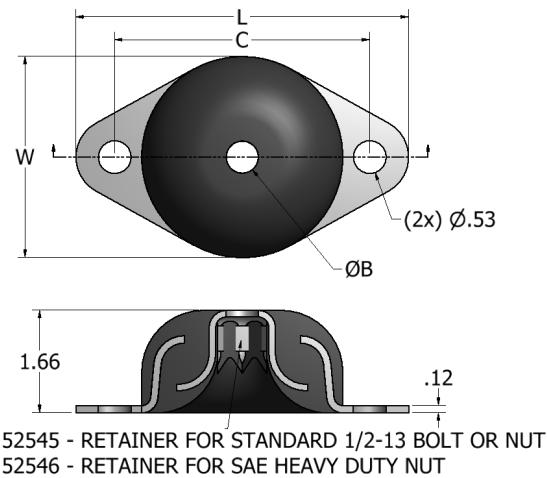

# Dome Mounts

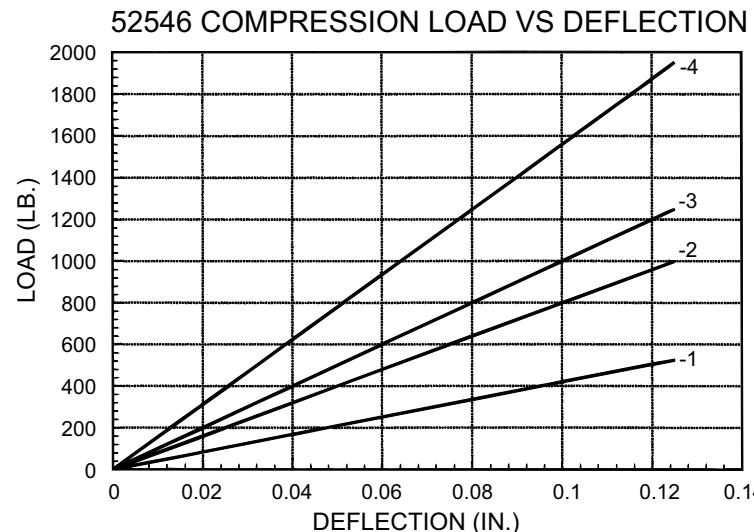

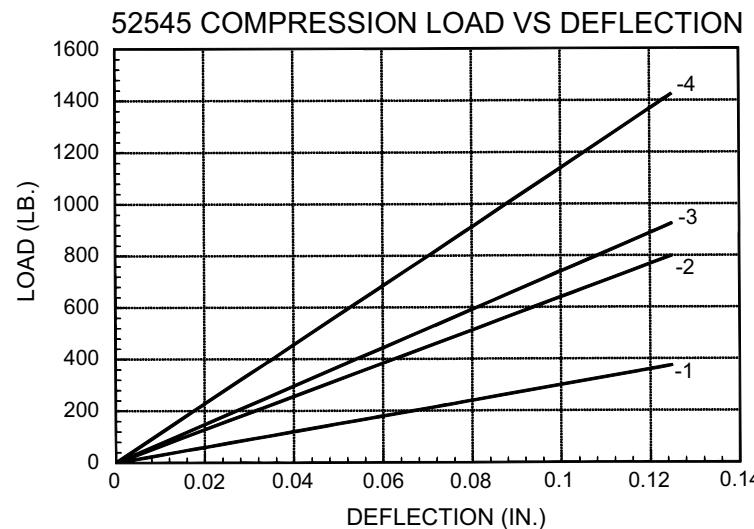

The interlocking metals of the Dome Mount series result in a fail-safe mount. This feature and low stiffness make them ideal for isolating medium to large size engines as well as fans, blowers, pumps and air handling equipment. They have an approximate natural frequency of 9Hz at maximum load.

- Internal metal components provide fail-safe design
- Standard neoprene elastomer resistant to oil, fuel, and solvents
- 9 Hz natural frequency at rated loads

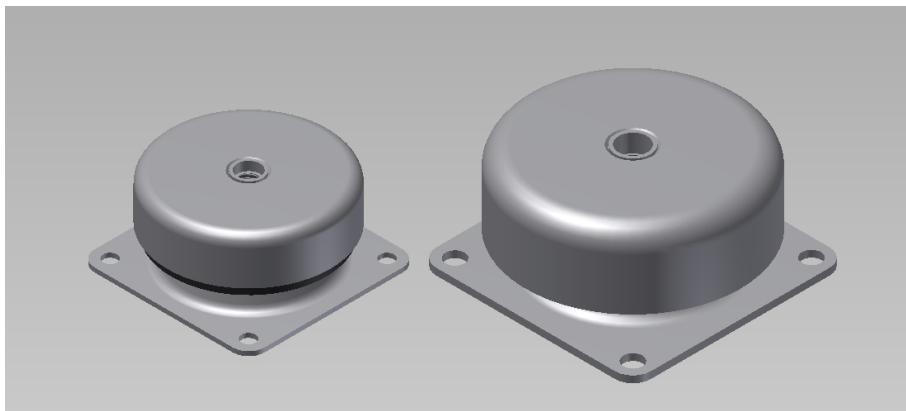

Part No.	Color Code	Max. Load (lbs.)	Spring Rate (lbs/in.)	L	W	C	B

# Dome Mounts

# Cupmounts

## Three Way Protection:

Help your sensitive equipment defend itself against high-impact shocks by installing Tech Products Cupmounts. These rugged and versatile mounts also control vibration and interrupt structure-borne noise. Under normal loading conditions, they exhibit natural frequencies of approximately 25 Hz and isolate disturbing frequencies above 35 Hz.

## Fail-safe Construction:

Available in four basic sizes, these compact, low-profile isolators have interlocking components of steel (other metals available) and standard neoprene or high damped silicone elastomers. They can be used to mount your equipment in compression, tension and shear applications. No matter how the mount is oriented or the load is directed, the elastomer is in compression.

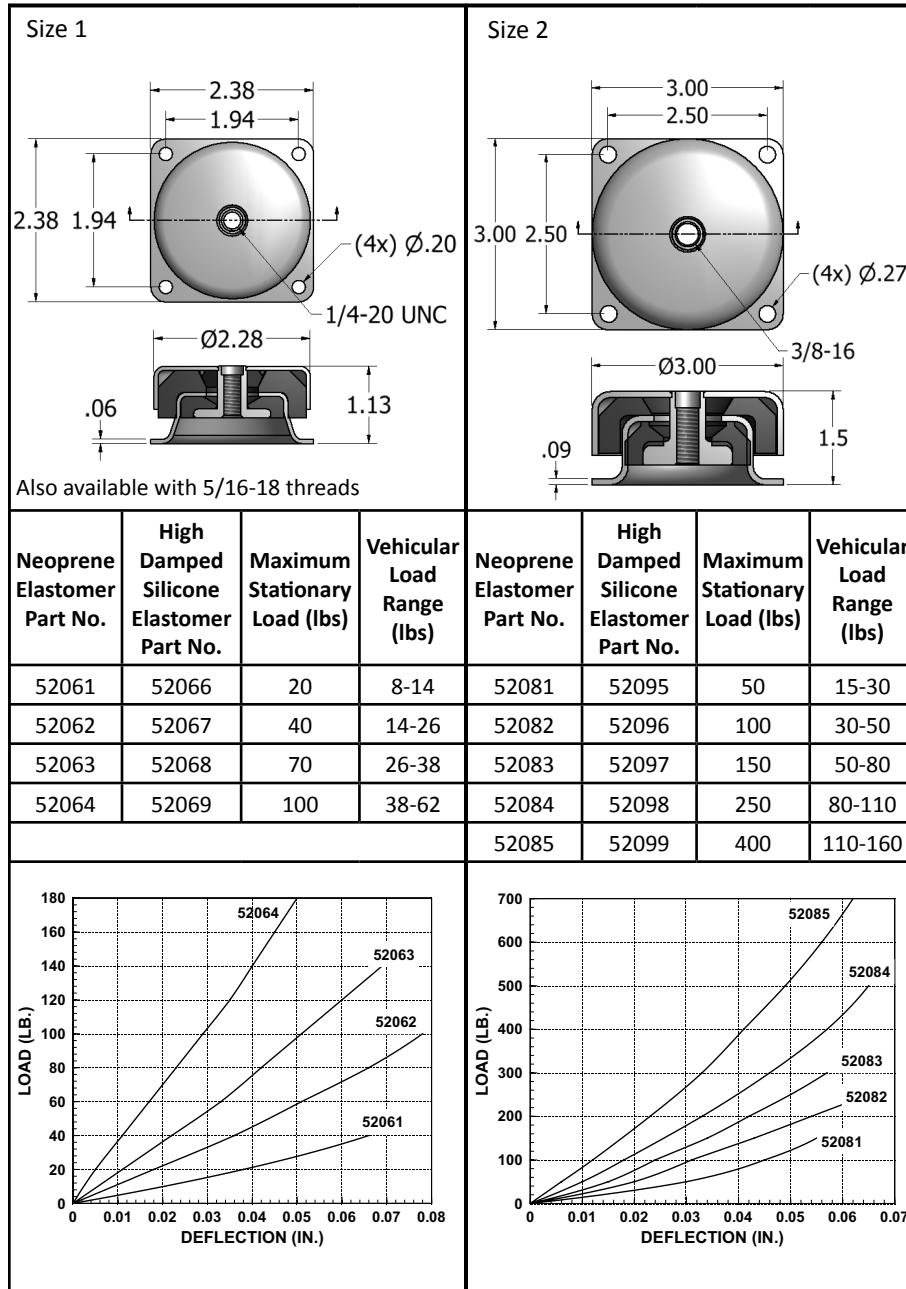

## Land, Sea and Air Uses:

Land, Sea and Air Uses: Great resistance to severe shock makes cupmounts ideal for protecting sensitive equipment on rough-terrain vehicles or railroad cars. Factories of all types use them for everything from numerically controlled machinery or electronic control panels to blowers. And they stand guard against shock on shipboard equipment, shipping containers, and both aircraft and missile electronics.

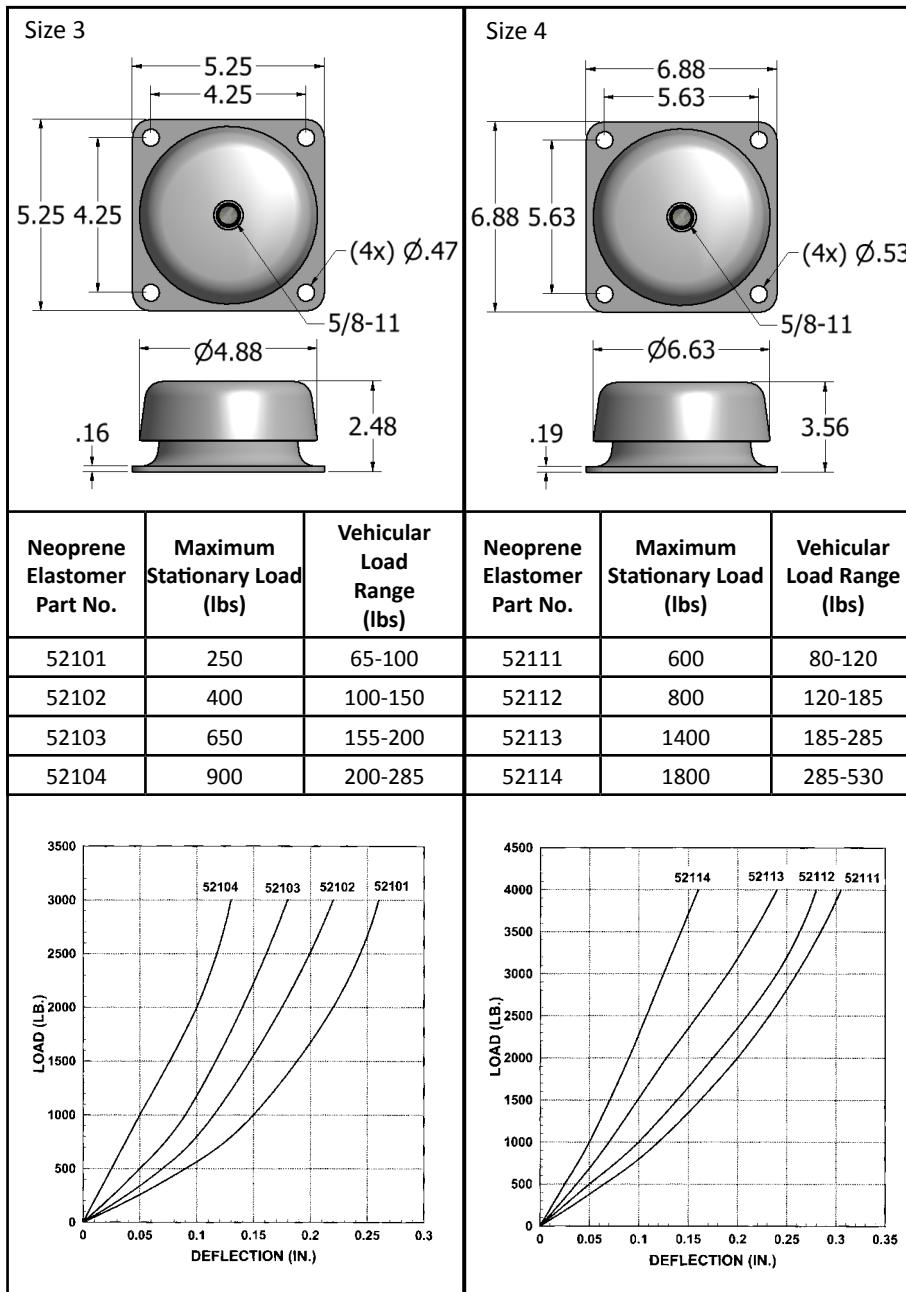

## Features:

- Compact Fail-Safe Design
- Capable of mounting in any orientation (compression, shear, tension)
- Standard Neoprene elastomer for -20°F to 180°F
- Optional High Damped Silicone elastomer for -80°F to 300°F
- Available with standard threads, metric threads, or through-hole cores
- Zinc Plated steel cap, base, and core

# Cupmounts

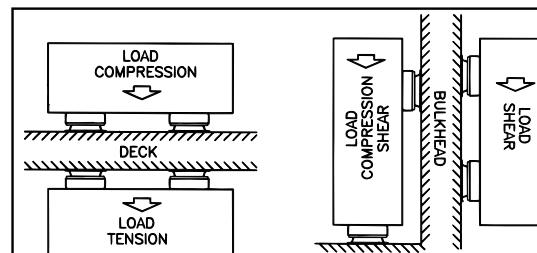

# Cupmounts

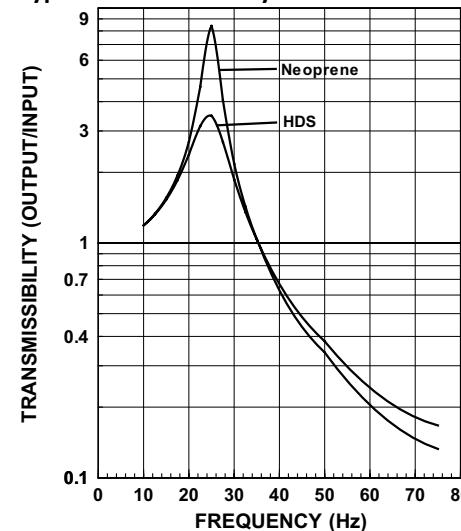

# Cupmounts

## Mounting Configurations

Since the elastomer is always in compression, cupmounts operate with equal efficiency in upright, inverted or bulk-head mounting positions, regardless of how the mount is oriented or the load directed.

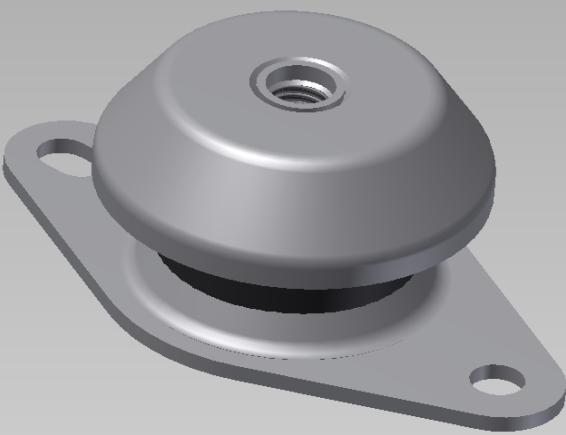

## Typical Transmissibility

## Elastomer Data

Environment	Neoprene	Silicone
Temperature	-20° to +180°F	-80° to +300°F
Ozone Resistance	Good	Excellent
Oil Resistance	Excellent	Good
Heat Aging	Good	Excellent

# Stable-Flex Mounts

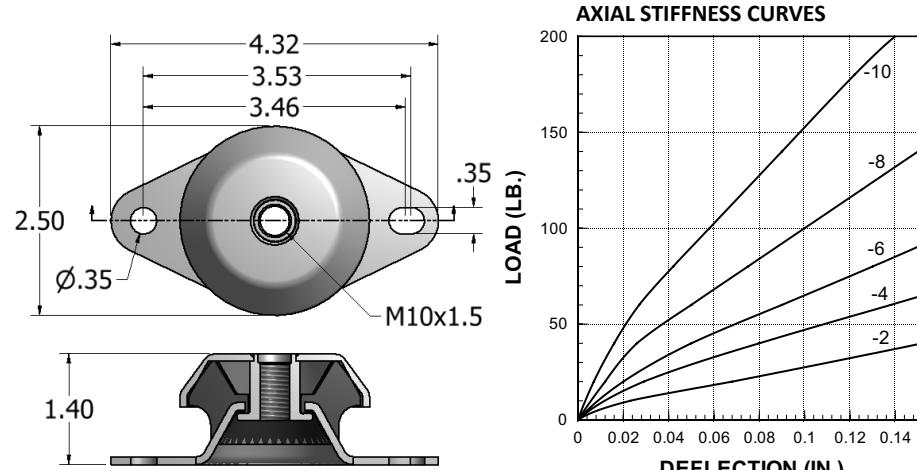

Tech Products' Stable Flex Mounts have been specifically engineered to isolate light weight, low speed equipment. The complex geometry of the elastomer element in the mount provides a low axial stiffness and excellent lateral stability. Common Applications include: Small Engines, Generators, Compressors, Pumps, Other Industrial Equipment, and Various Mobile Applications.

## Features:

- Fail-Safe Captive Design
- 8 Hz Natural Frequency at rated loads
- Load range from 30 to 180 lbs.
- Neoprene elastomer resistant to oil, fuel, and solvents
- Standard zinc plated steel components
- Specialty elastomers available including High Damped Silicone

# Stable-Flex Mounts

52045-10	52045-10SS	180	White

## Notes:

Add 'A' to part number for 3/8-16 Thread  
Stainless Steel parts have two slotted base holes

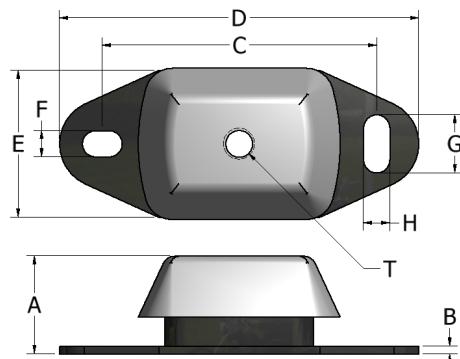

# Heavy Duty Stable-Flex Mounts

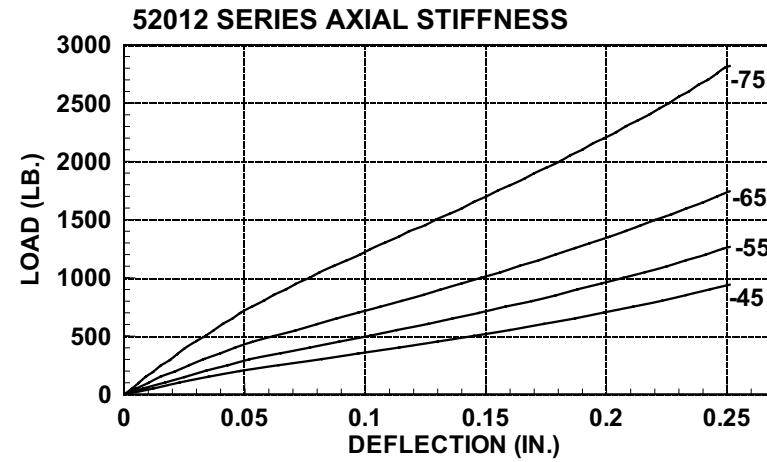

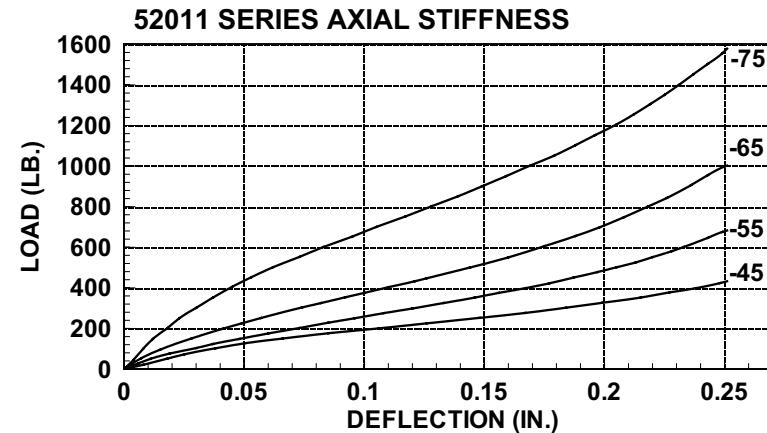

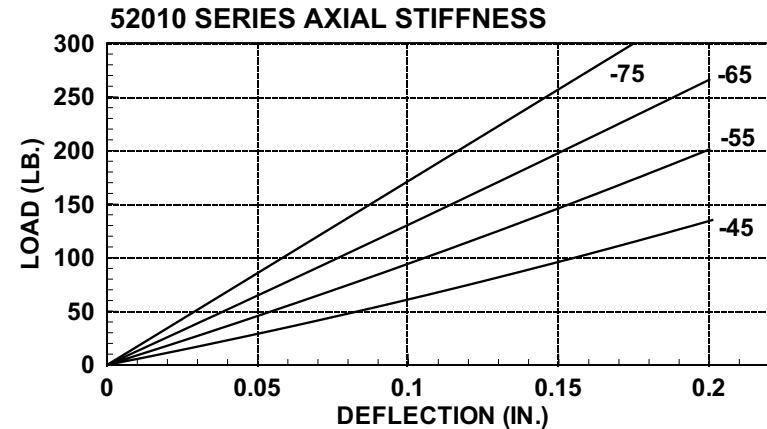

The Heavy Duty Stable Flex Mounts Series includes three sizes of captive isolators for rugged applications. The mounts are constructed of zinc plated steel and neoprene. Typical applications include diesel generator sets and marine engines.

The mounts offer a low vertical natural frequency of 8 Hz at rated load. Axial stiffness curves are included on the following page. Horizontal stiffness in the long direction is 2.5 times the axial stiffness and in the short direction it is 0.75 times the axial stiffness.

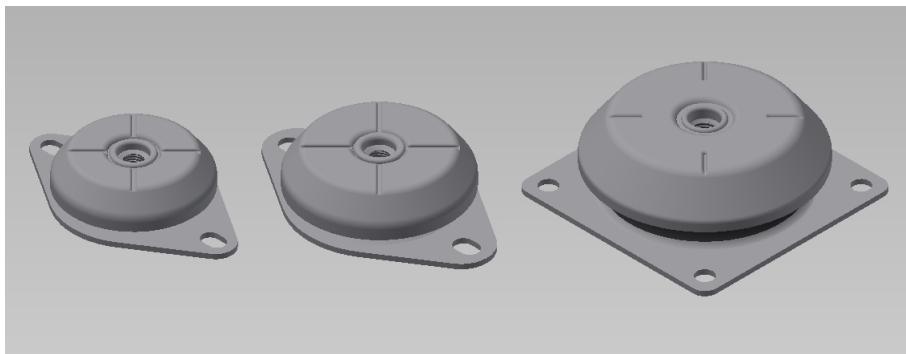

Part No.	A	B	C	D	E	F	G	H	T	Max. Load (lbs)

# Universal Mounts

Low-cost, easy-to-install Universal Mounts provide fail-safe, all-altitude isolation for vehicle cabs, engines, transmissions and other equipment up to 4550 lbs. in mobile applications.

Consisting of two parts—an elastomeric ring and an elastomeric bushing bonded to a center metal spacer—Universal Mounts are held in place with a through bolt.

# Armor Plated Universal Mounts

The Armor Plated Universal Mount can be used in the same applications as the standard Universal Mounts. But since it has bonded-in steel wear surfaces, it can be used in more extreme environments. These steel wear surfaces eliminate the need for machining a radius in the support structure.

- Fail-Safe installation when snubbing washers (Page 75) are used
- 8-10 Hz natural frequency at rated load
- Oil, Fuel, and Solvent resistant
- Neoprene elastomer
- -20°F to 180°F operating temperature range

## 60270 SERIES RADIAL LOAD VS DEFLECTION

# Self-Snubbing Universal Mounts

Self-Snubbing Universal Mounts include an internal metal cup that acts as a overload protection. This design protects the isolator from excessive compression in applications where high torque forces or shock inputs are expected. Typical applications include diesel engines, transmissions, and operator cabs.

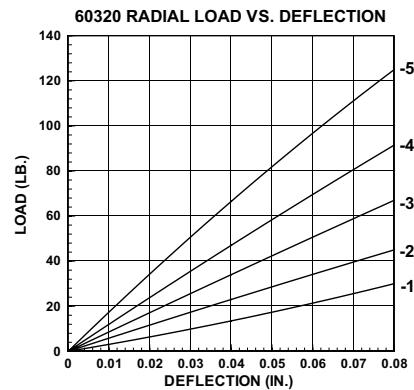

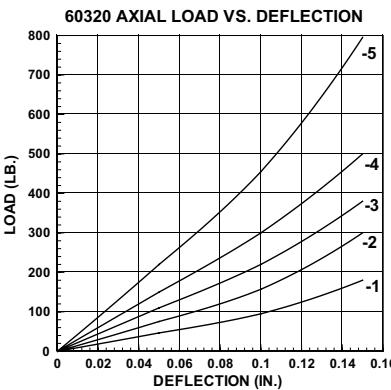

**NOTE:** Part numbers are for individual bushings.  
Bushings should be ordered and installed in pairs

# 515 Series Mounts

Compact 515 Series all-attitude mounts are a money-saving way to protect equipment from vibration and shock.

High load capacity, stability, and the ability to be installed at any mounting angle make them ideal for a wide variety of applications, including vehicle cabs; truck, bus and marine engines; generators; air conditioning units; motors and electronic equipment.

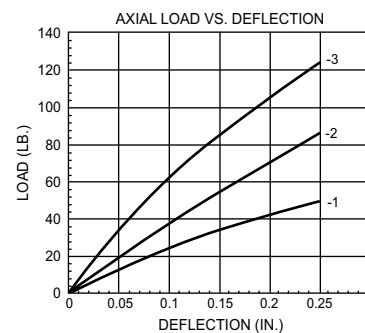

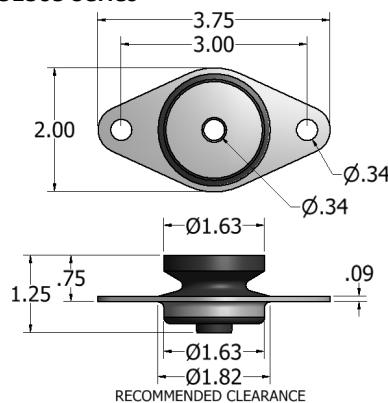

## Features

- All-Attitude design allows for mounting at any angle
- Fail-Safe Installation when proper snubbing washers (Page 75) are used
- 1:1 Axial to Radial Stiffness Ratio
- 8.5 Hz Natural Frequency at maximum load
- Oil, fuel, and solvent resistant Neoprene
- Temperature Range:  $-20^{\circ}$  to  $+180^{\circ}\text{F}$

# Center Bushing Mounts

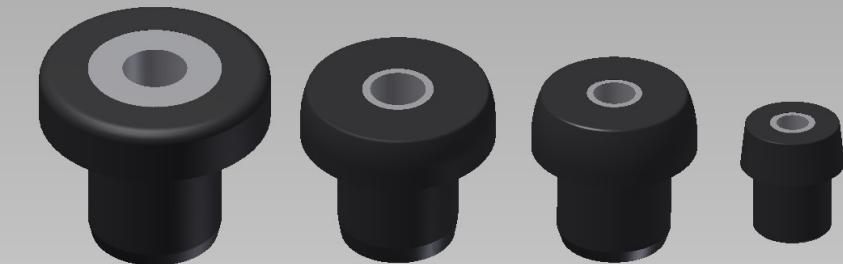

Tech Products' Center Bushing Mounts are fail-safe, multi-direction isolators for a variety of heavy duty applications. During Installation, a self-contained rebound is formed when the mounts resilient element spreads under compression. An internal sleeve serves as a positive spacer to control pre-loading.

# Center Bushing Mounts

This series of Center Bushing Mounts is designed with more rubber underneath the mounting structure for more rebound protection. They also offer higher deflection than the standard series for better isolation of lower frequency vibration.

## Heavy Duty Platemounts

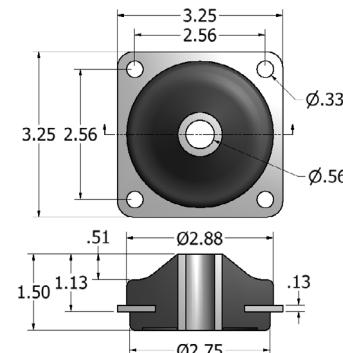

Tech Products' Heavy Duty Plate Mounts provide excellent vibration isolation for applications where a low natural frequency is required. At rated loads, these mounts provide a natural frequency below 7 Hz. Typical applications include gas and diesel engines, generator sets, pumps, compressors, and many other types of mobile equipment.

### 61591 Series

### 61592 Series

## 507 Series Mounts

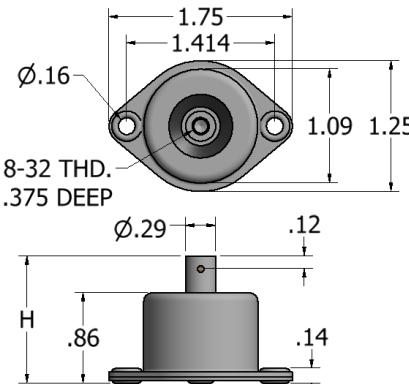

Tech Products' 507 Series Mounts are general purpose isolators for equipment mounted in aircraft, shipboard, or vehicular applications.

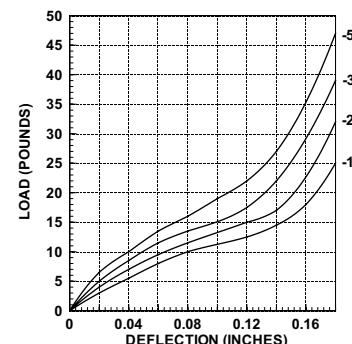

These mounts are designed to isolate high frequency vibration and the high damped silicone elastomer provides good shock attenuation and low resonant amplification. The three different sizes are designed to support load ranges from 1 to 80 lbs.

- Fail-Safe, All-Attitude Design
- 1:1 Axial to Radial Stiffness
- Isolation of Vibration over 40 Hz
- 4.0 Max. Transmissibility at Resonance
- High Damped Silicone Elastomer
- -80°F to 300°F Temperature Range

# All-Attitude Mounts

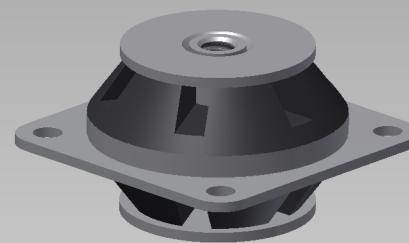

Tech Products' 56421 Series elastomeric mounts have an aluminum center plate suited for built-in electronics. The 56421 Series is a holder style for applications where a base mounted configuration is needed. The elastomer in compression design assures effective isolation in all directions.

The highly damped silicone elastomer provides optimum vibration isolation over a temperature range of  $-80^{\circ}$  to  $300^{\circ}$  F. The radial to axial stiffness ratio is approximately 0.6.

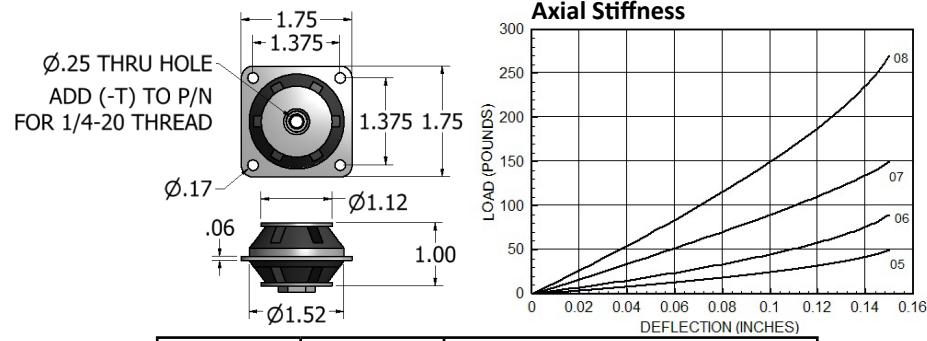

Part No.	Color Code	Max. Stationary Load (lbs.)
56421-30	Gray	3.0
56421-40	Red	4.5
56421-50	Yellow	7.0
56421-60	Green	10.0

# All-Attitude Mounts

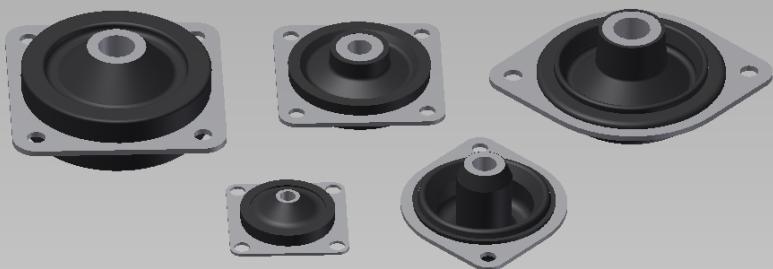

522 Series All-Attitude isolators protect stationary loads of 15-50 lbs. and vehicular loads up to 30 lbs. from vibration, shock and noise.

Neoprene elastomer is standard, but High Damped Silicone (HDS) is also available to meet application needs. Neoprene models have a temperature range of  $-20^{\circ}$  to  $180^{\circ}$  F with excellent resistance to oil and ozone. The HDS models have a temperature range of  $-80^{\circ}$  to  $300^{\circ}$  F and a maximum transmissibility of about 3.5.

Part No.	Color Code	Max. Stationary Load (lbs.)
52205	Red	15
52206	Green	25
52207	Yellow	35
52208	Blue	50

# Platemounts

Fail-safe operation of electronic and electro-mechanical equipment, appliances, office machines and transportation equipment are typical applications for Tech Products Plate Mounts.

Designed for light to medium loads, they isolate mounted equipment from external vibration and/or isolate vibration produced by the mounted equipment itself.

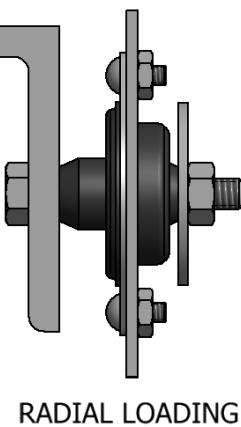

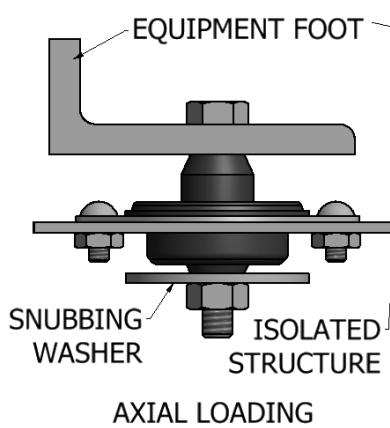

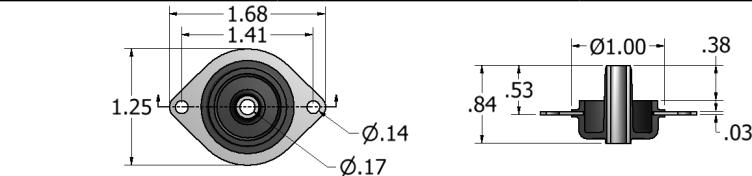

Plate Mounts feature steel and natural rubber which operate at temperatures of -20° to 180° F.

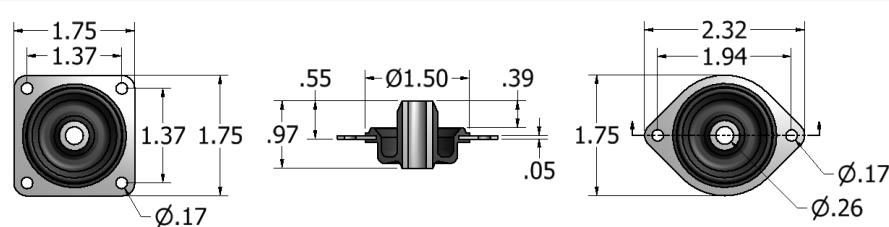

Part numbers are shown for steel plates. Aluminum plates and neoprene elastomer are available options.

# Ring and Bushing Mounts

Neoprene Ring and Bushing Mounts are incorporated directly into the structural components of equipment such as office machines, motors and pumps, as well as air conditioning, electronic and scientific equipment. They offer fail-safe operation when installed in pairs.

Opposing holes in the elastomer provide excellent low-frequency isolation. The location of the holes cushions shock and isolates vibration parallel to the mount axis. The bushing's holes isolate vibration perpendicular to its axis.

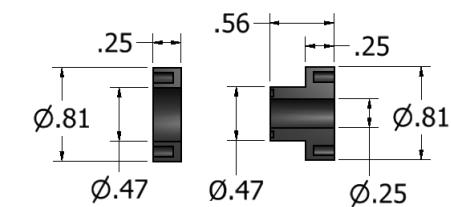

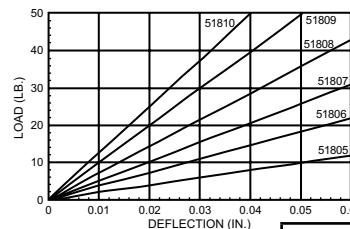

## Typical Mounting Application

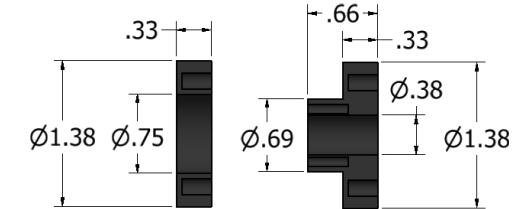

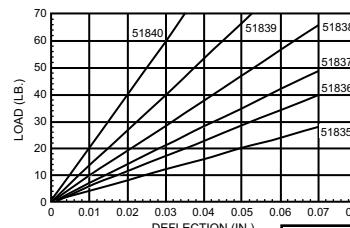

## Features

- Fail-Safe installation when proper snubbing washers and spacers are used
- Neoprene elastomer resistant to oil, fuel, and solvents
- Three sizes for loads ranging from 1 to 100 lbs.
- Operating temperature range of -20°F to 180°F

# Bubble Mounts

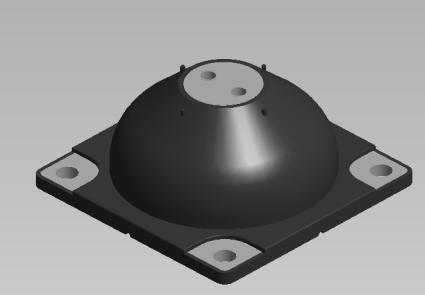

Low-frequency Bubble Mounts isolate electronic or medical equipment, avionics, computers, small pumps and compressors, and more from shock and vibration. Easy-to-install Bubble Mounts are primarily recommended for compression loads.

- Small compact design
- Excellent isolation of light loads
- 8 Hz Natural Frequency at rated loads
- Standard Neoprene elastomer resists oil, ozone, and most solvents
- Optional silicone elastomer available for extreme high or low temperatures

# High Deflection Silicone Mounts

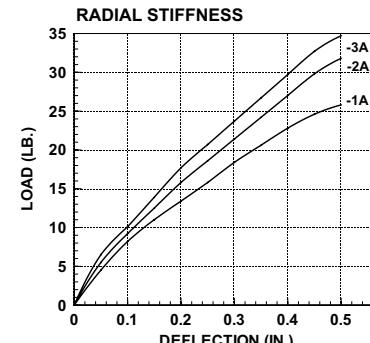

## Features:

- High Damped Silicone Elastomer
- Lightweight Aluminum metal components
- 1:1 Axial to Radial stiffness ratio
- -80°F to 300°F operating temperature range

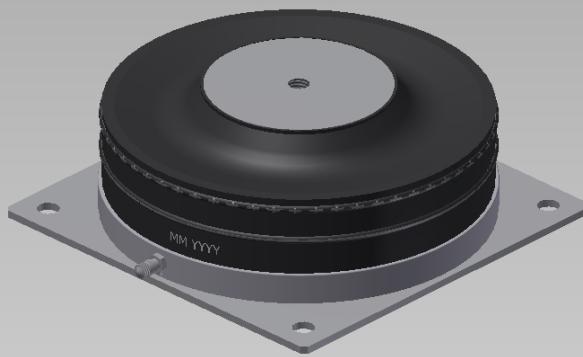

The High Deflection Silicone mounts are low profile isolators that have large deflection capability for shock and vibration attenuation. The mounts are designed to support loads ranging from 5 to 15 lbs. Retaining straps are available for fail-safe installation. Typical applications include ruggedized electronics and computer equipment.

Part Number	Load Range (lbs.)
61829-1A	5-7
61829-2A	7-10
61829-3A	10-15

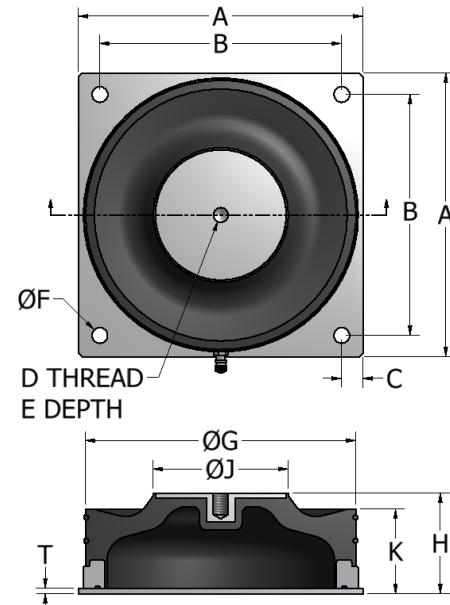

# Pneumatic Spring Mounts

Tech Products Pneumatic series are air spring mounts particularly well suited for situations requiring high deflection and natural frequencies as low as 2.75 Hz. The high stability and reliability of this mount is ideal for use in mounting vibrators, shakers, vacuum pumps, optical comparators, HVAC equipment and equipment subjected to low frequency shock and/or vibration.

## Features:

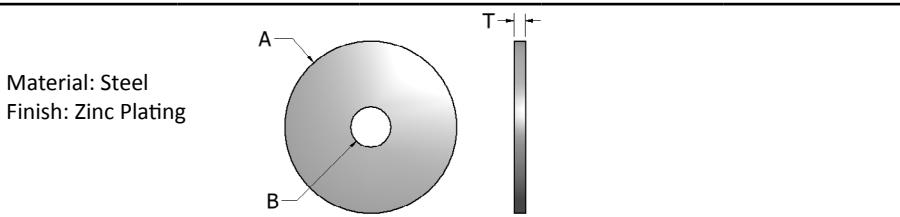

- Thick walled elastomeric construction
- Dynamic overload capacity of up to ten times maximum rated static load in compression
- Designed for air pressures of 20-85 psi
- Low Natural Frequency

# Stud/Plate Mounts

Tech Products offers one of the industry's largest selections of these multi-purpose mounts.

Stud/Plate mounts are known throughout the industry by several names including: bumpers, snubbers, feet, sandwich mounts, shockmounts, shearmounts, cylindrical mounts, isolators, levelers, and insulators.

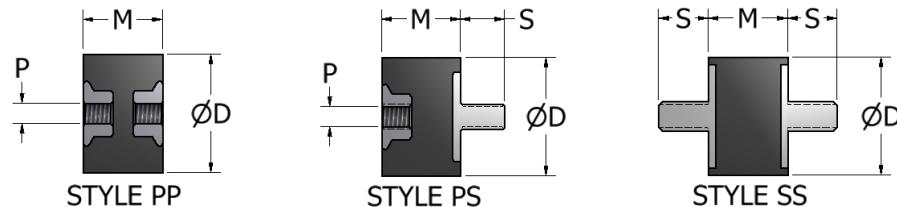

Tech Products' offers other sizes of mounts which may not be shown. Please contact us if you cannot find a specific size needed or if you need assistance selecting the proper mount.

Visit [www.novibes.com](http://www.novibes.com) for a searchable database of Tech Products Stud/Plate Mounts.

Maximum Tightening Torque	
UNC Thread	lbs-inch
6-32	10
8-32	15
10-32	25
1/4-20	53
5/16-18	105
3/8-16	192
1/2-13	600

Note: Do not twist elastomer during installation

Elastomer = Neoprene

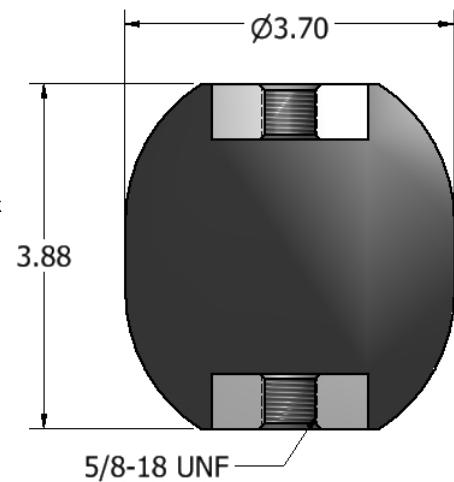

Inserts = Low Carbon Steel (Optional Stainless Steel Available)

## Isosphere Mounts

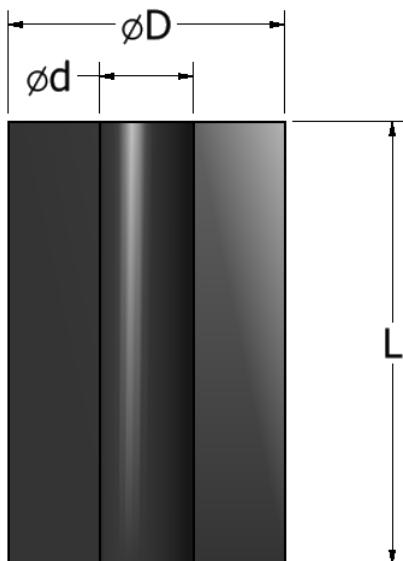

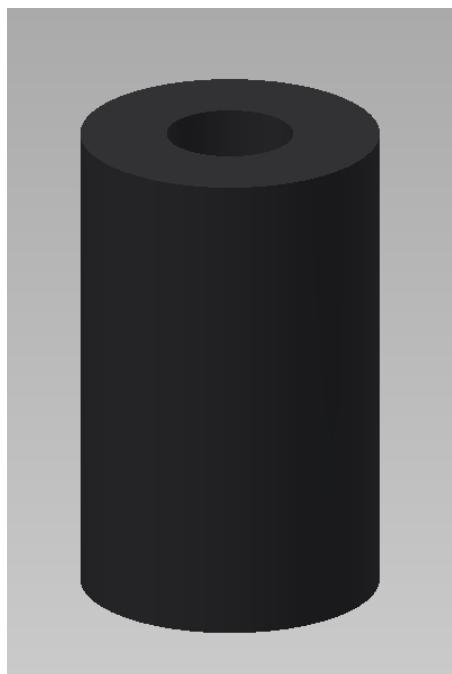

Isosphere mounts are designed to carry loads in compression. A near spherical shape is formed when the load is applied. The distinguishing non-linear stiffness characteristics make these mounts ideal for vibration isolation over a broad range of frequencies. Shock loads are isolated equally as well. Internal snubbing of a shock load occurs as deflection increases the stiffness of the mount. Applications include suspension systems spring elements, shock mounts, shaker screen springs, bumpers, and snubbers.

- Neoprene and zinc plated steel construction
- Non-Linear Stiffness characteristics
- Excellent Shock attenuation

Part No.	Color Code	Max. Static Load (lbs)	Max Dynamic Load (lbs)	Dynamic Spring Rate (lbs/in)
61549-2	Black	500	2000	1500
61549-3	Green	750	3000	2000

## Anti-Vibration Pad

The ribbed configuration of our Neoprene Pads provides firm footing to both floor and equipment, yet they allow mounted equipment to be relocated quickly and easily. Recommended for maximum loads of 50 psi.

Neoprene-Cork Pads accept a maximum load of 50 psi.

Natural Frequency approximately 10-15 Hz at maximum load.

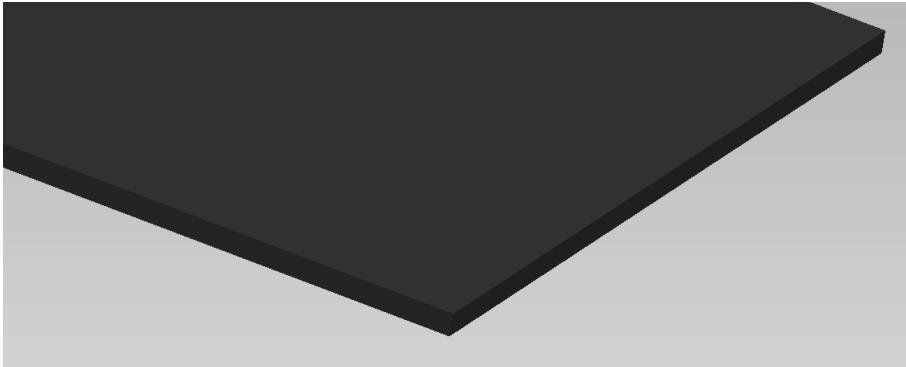

### Neoprene (Load Range 20-50 psi)

Part Number	Size (in.)
52347 Ribbed both sides	18 x 18 x 3/8
52348 Ribbed both sides	18 x 36 x 3/8
56780 Ribbed both sides	18 x 18 x 1/2

### Neoprene-Cork (Load Range 20-50 psi)

Part Number	Size (in.)
56803 Ribbed both sides	12 x 12 x 1
52337 Ribbed both sides	18 x 18 x 1
56779 Ribbed both sides	18 x 36 x 1

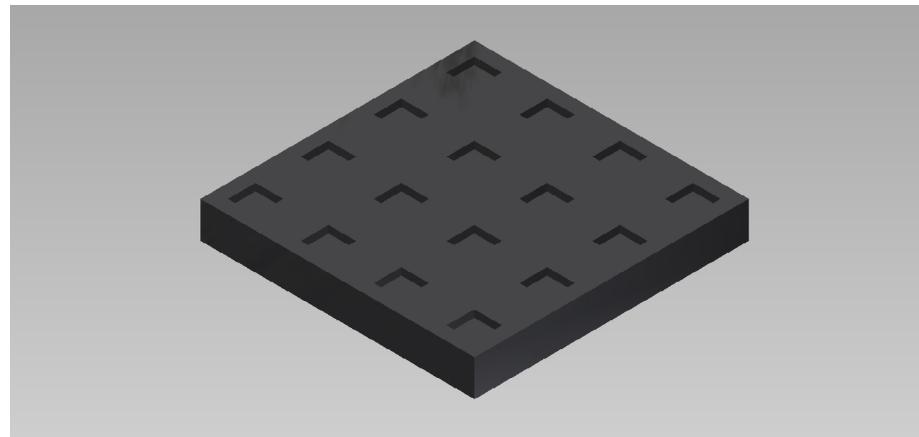

## Compression Pad

Multi-purpose neoprene isolation pads are used to eliminate vibration and transmitted noise. They offer good physical strength and high energy-absorbing characteristics.

Part Number	Color Code	Size (in.)	Max. Load (psi)
50100	Red	24 x 24 x 1/2	100
52330	Green	24 x 24 x 1/2	200
52331	White	24 x 24 x 1/2	300
52332	Green	12 x 12 x 1/2	200
52333	White	12 x 12 x 1/2	300
52334	Green	12 x 24 x 1/2	200
52335	White	12 x 24 x 1/2	300
52355	Blue-White	36 x 36 x 1/2	300
52746	Black	48 x 48 x 1/2	300

## Fabcel Pad

Fabcel vibration isolation pad is manufactured using the same nitrile compound developed in 1962. The properties of the Fabcel pad are designed to provide low frequency vibration isolation and reduction of impact shock.

Fabcel pad has been used for over 40 years for mounting machinery and sensitive equipment where absorption of impact shock or isolation of transmitted vibration is desired. Fabcel pads may be bonded together ("layered") to achieve the desired isolation efficiency for any application.

### Features:

- Fabcel pad can withstand loads up to 300 psi.
- Fabcel pad can have a vertical natural frequency as low as 5.0 Hz and a horizontal natural frequency as low as 3.0 Hz.
- Fabcel pad has a high energy storage rate per unit volume which makes it ideal for certain shock isolation applications.

Part No.	Max. Load (psi)	Size (in.)
Fabcel 25	25	18 x 18 x 5/16
Fabcel 50	50	18 x 18 x 5/16
Fabcel 100	100	18 x 18 x 5/16
Fabcel 200	200	18 x 18 x 1/2
Fabcel 300	300	18 x 18 x 1/2

# Warranty and Disclaimer

Tech Products Corporation agrees to correct any defect in workmanship or material in products sold which may develop under proper and normal use, by repair or replacement at Tech Products Corporation's option, F.O.B. our plant, of the defective part or parts, provided written notice of any such

defect describing the same is given to Tech Products Corporation within 30 days from the date of shipment. The responsibility of Tech Products Corporation with respect to any such defect in products sold is limited to such correction or replacement.

THE FOREGOING WARRANTY IS EXPRESSLY IN LIEU OF ANY OTHER WARRANTIES, EXPRESSED OR IMPLIED, INCLUDING ANY IMPLIED WARRANTY OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE, AND OF ANY OTHER OBLIGATIONS OR LIABILITY ON THE PART OF TECH PRODUCTS CORPORATION, EXCEPT THAT IN NO CASE SHALL THE LIABILITY OF TECH PRODUCTS CORPORATION ARISING OUT OF THIS SALE EXCEED THE SALES PRICE OF THE PRODUCTS COVERED HEREUNDER.

No returns are accepted without written authorization from Tech Products Corporation. A restocking charge may be necessary on all unused materials returned. All returned materials are

F.O.B. our plant. Returned items must have a Return Material Authorization (RMA) from Tech Products Corporation.
